

Sourdough Starter Maintenance Log

Reusable template — track your starter's health over time, separate from individual bakes

Fill in the profile once when you start (or revive) a starter. Use the Feeding Log pages to track day-to-day feedings, and the Health Check-in table for a periodic (weekly or monthly) overall read on how the starter's doing.

Starter Profile	
Starter Name	
Born On (date started)	
Typical Flour Blend	
Hydration Ratio (usually 100%)	
Typical Feed Ratio (starter:flour:water)	
Storage (circle): Counter / Fridge / Both	

How to read the Feeding Log

Time to Peak: how long from feeding until the starter domes and is ready to use (a ripe starter typically reads roughly pH 3.8–4.5, if you're checking with a meter — the dome-and-jiggle test is the everyday check). Hooch: the thin liquid that separates on top when a starter is hungry — occasional hooch is normal, especially before a feed; frequent hooch may mean it's time to feed more often or increase the ratio. Action Taken: Fed / Baked With / Discarded Portion / Moved to Fridge.

Feeding Log

Periodic Health Check-in

A slower spot-check across weeks or months — useful for catching a slow drift (weaker rise, persistent off-smell) that's easy to miss feeding-to-feeding.
